JAC444 Workshop 9: A Simple RMI Application

Note: You will not receive any marks for doing this workshop.

PROBLEM DSECRIPTION

Convert the Simple Client and Simple Server application into an RMI application. Remember that the Simple Client asks the user to enter a radius of a circle and then send it to the Simple Server. It repeats doing it four times. In order to use the RMI technology, you must design a remote interface. Then you code the implementation class, the RMI server and the RMI client. You should use 6666 as the port number.

No submission is required.

Note: Use command lines to run your application. You could encounter problems if you run your RMI application within Eclipse.
